# Chapter Twelve **THERMODYNAMICS**

# **MCQ I**

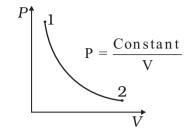

- An ideal gas undergoes four different processes from the 12.1 same initial state (Fig. 12.1). Four processes are adiabatic, isothermal, isobaric and isochoric. Out of 1, 2, 3 and 4 which one is adiabatic. Ρ
  - (a) 4
  - (b) 3
  - (c) 2
  - (d) 1
- If an average person jogs, hse produces  $14.5 \times 10^3$  cal/min. This is 12.2 removed by the evaporation of sweat. The amount of sweat evaporated per minute (assuming 1 kg requires  $580 \times 10^3$  cal for evaparation) is
  - (a) 0.25 kg
  - (b) 2.25 kg
  - (c) 0.05 kg
  - (d) 0.20 kg

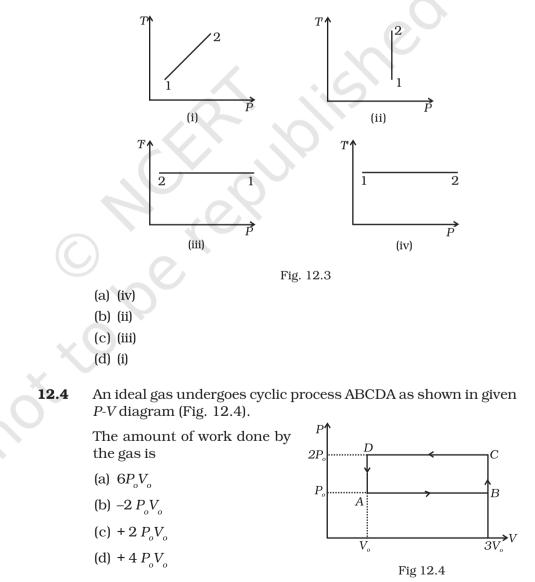

### Exemplar Problems–Physics

**12.3** Consider *P*-*V* diagram for an ideal gas shown in Fig 12.2.

Out of the following diagrams (Fig. 12.3), which represents the *T*-*P* diagram?

**12.5** Consider two containers A and B containing identical gases at the same pressure, volume and temperature. The gas in container A is compressed to half of its original volume isothermally while the gas in container B is compressed to half of its original value adiabatically. The ratio of final pressure of gas in B to that of gas in A is

(a) 
$$2^{\gamma-1}$$

(b) 
$$\left(\frac{1}{2}\right)^{\gamma-1}$$
  
(c)  $\left(\frac{1}{1-\gamma}\right)^2$   
(d)  $\left(\frac{1}{\gamma-1}\right)^2$ 

**12.6** Three copper blocks of masses  $M_1$ ,  $M_2$  and  $M_3$  kg respectively are brought into thermal contact till they reach equilibrium. Before contact, they were at  $T_1$ ,  $T_2$ ,  $T_3$  ( $T_1 > T_2 > T_3$ ). Assuming there is no heat loss to the surroundings, the equilibrium temprature T is (s is specific heat of copper)

(a) 
$$T = \frac{T_1 + T_2 + T_3}{3}$$
  
(b)  $T = \frac{M_1 T_1 + M_2 T_2 + M_3}{M_1 + M_2 + M_3}$   
(c)  $T = \frac{M_1 T_1 + M_2 T_2 + M_3}{3(M_1 + M_2 + M_3)}$ 

(d) 
$$T = \frac{M_1 T_1 s + M_2 T_2 s + M_3 T_3 s}{M_1 + M_2 + M_3}$$

# **MCQ II**

- **12.7** Which of the processes described below are irreversible?
  - (a) The increase in temprature of an iron rod by hammering it.
  - (b) A gas in a small cantainer at a temprature  $T_1$  is brought in contact with a big reservoir at a higher temprature  $T_2$  which increases the temprature of the gas.
  - (c) A quasi-static isothermal expansion of an ideal gas in cylinder fitted with a frictionless piston.

#### **Exemplar Problems–Physics**

- (d) An ideal gas is enclosed in a piston cylinder arrangement with adiabatic walls. A weight W is added to the piston, resulting in compression of gas.
- **12.8** An ideal gas undergoes isothermal process from some initial state i to final state f. Choose the correct alternatives.
  - (a) dU = 0
  - (b) d*Q*= 0
  - (c) dQ = dU
  - (d) dQ = dW
  - Figure 12.5 shows the *P*-*V* diagram of an ideal gas undergoing a change of state from A to B. Four different parts I, II, III and IV as shown in the figure may lead to the same change of state.
    - (a) Change in internal energy is same in IV and III cases, but not in I and II.
    - (b) Change in internal energy is same in all the four cases.
    - (c) Work done is maximum in case I
    - (d) Work done is minimum in case II.

#### **12.10** Consider a cycle followed by an engine (Fig. 12.6)

- 1 to 2 is isothermal
- 2 to 3 is adiabatic
- 3 to 1 is adiabatic

Such a process does not exist because

- (a) heat is completely converted to mechanical energy in such a process, which is not possible.
- (b) mechanical energy is completely converted to heat in this process, which is not possible.
- (c) curves representing two adiabatic processes don't intersect.
- (d) curves representing an adiabatic process and an isothermal process don't intersect.

**12.11** Consider a heat engine as shown in Fig. 12.7.  $Q_1$  and  $Q_2$  are heat added to heat bath  $T_1$  and heat taken from  $T_2$  in one cycle of engine. *W* is the mechanical work done on the engine.

If W > 0, then possibilities are:

(a)  $Q_1 > Q_2 > 0$ (b)  $Q_2 > Q_1 > 0$ (c)  $Q_2 < Q_1 < 0$ (d)  $Q_1 < 0, Q_2 > 0$

# VSA

- **12.12** Can a system be heated and its temperature remains constant?
- **12.13** A system goes from P to Q by two different paths in the *P-V* diagram as shown in Fig. 12.8. Heat given to the system in path 1 is 1000 J. The work done by the system along path 1 is more than path 2 by 100 J. What is the heat exchanged by the system in path 2?
- **12.14** If a refrigerator's door is kept open, will the room become cool or hot? Explain.
- **12.15** Is it possible to increase the temperature of a gas without adding heat to it? Explain.
- 12.16 Air pressure in a car tyre increases during driving. Explain.

## SA

- **12.17** Consider a Carnot's cycle operating between  $T_1 = 500$  K and  $T_2=300$  K producing 1 k J of mechanical work per cycle. Find the heat transferred to the engine by the reservoirs.
- **12.18** A person of mass 60 kg wants to lose 5kg by going up and down a 10m high stairs. Assume he burns twice as much fat while going up than coming down. If 1 kg of fat is burnt on expending 7000 kilo calories, how many times must he go up and down to reduce his weight by 5 kg?
- **12.19** Consider a cycle tyre being filled with air by a pump. Let *V* be the volume of the tyre (fixed) and at each stroke of the pump  $\Delta V(V)$  of air is transferred to the tube adiabatically. What is the work done when the pressure in the tube is increased from  $P_1$  to  $P_2$ ?
- **12.20** In a refrigerator one removes heat from a lower temperature and deposits to the surroundings at a higher temperature. In this process, mechanical work has to be done, which is provided by an electric motor. If the motor is of 1kW power, and heat is transferred from -3°C to 27°C, find the heat taken out of the refrigerator per second assuming its efficiency is 50% of a perfect engine.

P'VFig. 12.8

#### **Exemplar Problems–Physics**

- **12.21** If the co-efficient of performance of a refrigerator is 5 and operates at the room temperature (27 °C), find the temperature inside the refrigerator.
- **12.22** The initial state of a certain gas is  $(P_i, V_i, T_i)$ . It undergoes expansion till its volume becoms  $V_f$ . Consider the following two cases:
  - (a) the expansion takes place at constant temperature.
  - (b) the expansion takes place at constant pressure.

Plot the *P*-*V* diagram for each case. In which of the two cases, is the work done by the gas more?

## LA

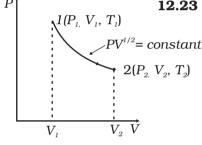

Fig. 12.9

- (a) Find the work done when the gas is taken from state 1 to state 2.
- (b) What is the ratio of temperature  $T_1/T_2$ , if  $V_2 = 2V_1$ ?
- (c) Given the internal energy for one mole of gas at temperature *T* is (3/2) *RT*, find the heat supplied to the gas when it is taken from state 1 to 2, with  $V_2 = 2V_1$ .

**12.24** A cycle followed by an engine (made of one mole of perfect gas in a cylinder with a piston) is shown in Fig. 12.10.

- A to B : volume constant
- B to C : adiabatic
- C to D : volume constant
- D to A : adiabatic
- $V_C = V_D = 2V_A = 2V_B$
- (a) In which part of the cycle heat is supplied to the engine from outside?
- (b) In which part of the cycle heat is being given to the surrounding by the engine?
- (c) What is the work done by the engine in one cycle? Write your answer in term of  $P_A$ ,  $P_B$ ,  $V_A$ .
- (d) What is the efficiency of the engine?

$$\gamma = \frac{5}{3}$$
 for the gas],  $(C_v = \frac{3}{2}R$  for one mole)

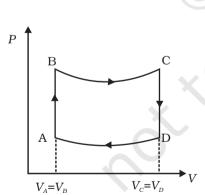

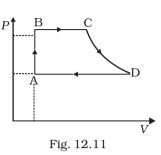

Fig. 12.10

20/04/2018

- **12.25** A cycle followed by an engine (made of one mole of an ideal gas in a cylinder with a piston) is shown in Fig. 12.11. Find heat exchanged by the engine, with the surroundings for each section of the cycle.  $(C_p = (3/2) R)$ 
  - AB : constant volume
  - BC : constant pressure
  - CD : adiabatic
  - DA : constant pressure
- **12.26** Consider that an ideal gas (*n* moles) is expanding in a process given by P = f(V), which passes through a point  $(V_o, P_o)$ . Show that the gas is absorbing heat at  $(P_o, V_o)$  if the slope of the curve P = f(V) is larger than the slope of the adiabat passing through  $(P_o, V_o)$ .
- **12.27** Consider one mole of perfect gas in a cylinder of unit cross section with a piston attached (Fig. 12.12). A spring (spring constant k) is attached (unstretched length L) to the piston and to the bottom of the cylinder. Initially the spring is unstretched and the gas is in equilibrium. A certain amount of heat Q is supplied to the gas causing an increase of volume from V<sub>a</sub> to V<sub>1</sub>.
  - (a) What is the initial pressure of the system?
  - (b) What is the final pressure of the system?
  - (c) Using the first law of thermodynamics, write down a relation between *Q*, *P<sub>a</sub>*, *V*, *V<sub>o</sub>* and *k*.

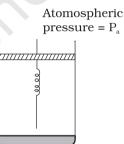

Fig. 12.12
